This article explores memory sharing and protection support in Opal, a single-address-space operating system designed for wide-address (64-bit) architectures. Opal threads execute within protection domains in a single shared virtual address space. Sharing is simplified, because addresses are context independent. There is no loss of protection, because addressability and access are independent; the right to access a segment is determined by the protection domain in which a thread executes. T ...

A foundation for an efficient multi-threaded scheme system

Suresh Jagannathan, Jim Philbin

January 1992 ACM SIGPLAN Lisp Pointers, Proceedings of the 1992 ACM conference on LISP and functional programming, Volume V Issue 1

Full text available: pdf(1 19 MB)

Additional Information: full citation, abstract, references, citings, index terms

We have built a parallel dialect of Scheme called STING that differs from its contemporaries in a number of important respects. STING is intended to be used as an operating system substrate for modern parallel programming languages. The basic concurrency management objects is STING are first-class lightweight threads of control and virtual processors (VPs). Unlike high-level concurrency structures, STING threads and VPs are not encumbered by

complex synchronization protocols. ...

4 Implementation of Argus

B. Liskov, D. Curtis, P. Johnson, R. Scheifer

November 1987 ACM SIGOPS Operating Systems Review, Proceedings of the eleventh ACM Symposium on Operating systems principles, Volume 21 Issue 5

Full text available: pdf(1.34 MB)

Additional Information: <u>full citation</u>, <u>abstract</u>, <u>references</u>, <u>citings</u>, <u>index</u>

Argus is a programming language and system developed to support the construction and execution of distributed programs. This paper describes the implementation of Argus, with particular emphasis on the way we implement atomic actions, because this is where Argus differs most from other implemented systems. The paper also discusses the performance of Argus. The cost of actions is quite reasonable, indicating that action systems like Argus are practical.

Full text available: #3.pdf(1.49 MB)

Additional Information: full citation, references, citings, index terms

7 Supporting dynamic data structures on distributed-memory machines Anne Rogers, Martin C. Carlisle, John H. Reppy, Laurie J. Hendren March 1995 ACM Transactions on Programming Languages and Systems (TOPLAS), Volume 17 Issue 2

Full text available: psf(2.05 MB)

Additional Information: <u>full citation</u>, <u>abstract</u>, <u>references</u>, <u>citings</u>, <u>index</u> terms, <u>review</u>

Compiling for distributed-memory machines has been a very active research area in recent years. Much of this work has concentrated on programs that use arrays as their primary data structures. To date, little work has been done to address the problem of supporting programs that use pointer-based dynamic data structures. The techniques developed for supporting SPMD execution of array-based programs rely on the fact that arrays are statically defined and directly addressable. Recursive data s ...

8 Whole-program optimization for time and space efficient threads

Dirk Grunwald, Richard Neves

September 1996 Proceedings of the seventh international conference on Architectural support for programming languages and operating systems, Volume 31, 30 Issue 9, 5

Full text available: pdf(1.11 MB)

Additional Information: fall citation, abstract, references, citings, index terms

Modern languages and operating systems often encourage programmers to use threads, or

independent control streams, to mask the overhead of some operations and simplify program structure. Multitasking operating systems use threads to mask communication latency, either with hardwares devices or users. Client-server applications typically use threads to simplify the complex control-flow that arises when multiple clients are used. Recently, the scientific computing community has started using ...

The shared-memory language pSather on a distributed-memory multiprocessor Jerome A. Feldman, Chu-Cheow Lim, Thomas Rauber January 1993 ACM SIGPLAN Notices, Volume 28 Issue 1

10 Space efficient conservative garbage collection

Hans-Juergen Boehm

June 1993 ACM SIGPLAN Notices, Proceedings of the ACM SIGPLAN 1993 conference on Programming language design and implementation, Volume 28 Issue 6

Full text available: pdf(1.03 MB)

Additional Information: full citation, abstract, references, citings, index terms

We call a garbage collector conservative if it has only partial information about the location of pointers, and is thus forced to treat arbitrary bit patterns as though they might be pointers, in at least some cases. We show that some very inexpensive, but previously unused techniques can have dramatic impact on the effectiveness of conservative garbage collectors in reclaiming memory. Our most significant observation is that static data that appears to point to the heap should not result i ...

11 TeleNotes: managing lightweight interactions in the desktop

Steve Whittaker, Jerry Swanson, Jakov Kucan, Candy Sidner

June 1997 ACM Transactions on Computer-Human Interaction (TOCHI), Volume 4 Issue 2

Full text available: pdf(1.01 MB)

Additional Information: full citation, abstract, references, citings, index terms

Communication theories and technology have tended to focus on extended, formal meetings and have neglected a prevalent and vital form of workplace communication—namely, lightweight communication. Unlike formal, extended meetings, lightweight interaction is brief, informal, unplanned, and intermittent. We analyze naturalistic data from a study of work-place communication and derive five design criteria for lightweight interaction systems. These criteria require that systems for lightwe ...

12 A memory-efficient real-time non-copying garbage collector

Tian F. Lim, Przemysław Pardyak, Brian N. Bershad

October 1998 ACM SIGPLAN Notices, Proceedings of the 1st international symposium on Memory management, Volume 34 Issue 3

Full text available: 📆 <u>self(1.58 MB)</u>

Additional Information: full citation, abstract, references, citings, index

Garbage collectors used in embedded systems such as Personal Java and Inferno or in operating systems such as SPIN must operate with limited resources and minimize their impact on application performance. Consequently, they must maintain short real-time pauses, low overhead, and a small memory footprint. Most garbage collectors, including the Treadmill algorithm, are inadequate because they sacrifice space for time. We have implemented a new Treadmill variant that provides good memory utilizatio ...

Keywords: garbage collection, operating systems, real-time, treadmill

13 Pthreads for dynamic and irregular parallelism Girija J. Narlikar, Guy E. Blelloch November 1998 Proceedings of the 1998 ACM/IEEE conference on Supercomputing (CDROM) Full text available: [8] <a href="httm://example.com/httm://example.co High performance applications on shared memory machines have typically been written in a coarse grained style, with one heavyweight thread per processor. In comparison, programming with a large number of lightweight, parallel threads has several advantages, including simpler coding for programs with irregular and dynamic parallelism, and better adaptability to a changing number of processors. The programmer can express a new thread to execute each individual parallel task; the implementation dyn ... Keywords: Pthreads, dynamic scheduling, irregular parallelism, lightweight threads, multithreading, space efficiency 14 KDB: a multi-threaded debugger for multi-threaded applications Peter A. Buhr, Martin Karsten, Jun Shih January 1996 Proceedings of the SIGMETRICS symposium on Parallel and distributed tools Full text available: cost(991.10 KB) Additional Information: full ortation, references, criticis, index terms 15 The effectiveness of affinity-based scheduling in multiprocessor network protocol processing (extended version) James D. Salehi, James F. Kurose, Don Towsley August 1996 IEEE/ACM Transactions on Networking (TON), Volume 4 Issue 4 Full text available: pdf(1.71 MB) Additional Information: full citation, references, citings, index terms 16 The Amber system: parallel programming on a network of multiprocessors. J. Chase, F. Amador, E. Lazowska, H. Levy, R. Littlefield November 1989 ACM SIGOPS Operating Systems Review, Proceedings of the twelfth ACM symposium on Operating systems principles, Volume 23 Issue 5 Additional Information: full ottation, abstract, references, citings, index Full text available: Resif(1.53 MB) terms This paper describes a programming system called Amber that permits a single application program to use a homogeneous network of computers in a uniform way, making the network appear to the application as an integrated multiprocessor. Amber is specifically designed for high performance in the case where each node in the network is a sharedmemory multiprocessor. Amber shows that support for loosely-coupled multiprocessing can be efficiently realized using an obje ...

17 Efficient large-scale process-oriented parallel simulations

December 1998 Proceedings of the 30th conference on Winter simulation

Kalyan S. Perumalla, Richard M. Fujimoto

Full text available: (63.76 KB) Additional Information: full obtation, references, citings, index terms 18 Real-time concurrent collection on stock multiprocessors A. W. Appel, J. R. Ellis, K. Li June 1988 ACM SIGPLAN Notices, Proceedings of the ACM SIGPLAN 1988 conference on Programming Language design and Implementation, Volume 23'Issue 7 Additional Information: full citation, abstract, references, citings, index Full text available: pdf(1.21 MB) terms We've designed and implemented a copying garbage-collection algorithm that is efficient, real-time, concurrent, runs on commercial uniprocessors and shared-memory multiprocessors, and requires no change to compilers. The algorithm uses standard virtualmemory hardware to detect references to "from space" objects and to synchronize the collector and mutator threads. We've implemented and measured a prototype running on SRC's 5-processor Firefly. It will be straightforward to merg ... 19 Object and native code thread mobility among heterogeneous computers (includes sources) B. Steensgaard, E. Jul December 1995 ACM SIGOPS Operating Systems Review, Proceedings of the fifteenth ACM symposium on Operating systems principles, Volume 29 Issue 5 Full text available: cof(1.50 MB) Additional Information: full estation, references, estings, index terms 20 Application downloading Robert Balzer, Alvin Cooperband, Martin Feather, Philip London, David Wile March 1981 Proceedings of the 5th international conference on Software engineering Full text available: pdf(774.21 KB) Additional Information: full citation, abstract, references, index terms The purpose of our research is to investigate the feasibility of this methodology for distributed application development by examining possible approaches to carrying out such developments. In particular, our emphasis lies in transformation technology, wherein userinvoked source-to-source transformations are applied to the partitioned system for the purpose of optimizing the transactions required to effect the distributed behavior. In this way, the application downloading system need only ... Results 1 - 20 of 44 Result page: 1 2 3 next The ACM Portal is published by the Association for Computing Machinery. 24 OpenMP on networks of workstations

Honghui Lu, Y. Charlie Hu, Willy Zwaenepoel

November 1998 Proceedings of the 1998 ACM/IEEE conference on Supercomputing (CDROM)

We describe an implementation of a sizable subset of OpenMP on networks of workstations (NOWs). By extending the availability of OpenMP to NOWs, we overcome one of its primary drawbacks compared to MPI, namely lack of portability to environments other than hardware shared memory machines. In order to support OpenMP execution on NOWs, our compiler targets a software distributed shared memory system (DSM) which provides multithreaded execution and memory consistency. This paper presents two contri ...

	Moving resource management out of the operating system kernel facilitates a high degree of customisation. The lowest layer of the Arena system provides an abstract interface to conventional processor hardware (Mayes, 1993; Quick, 1995). The idea is to encapsulate the hardware behind an interface with certain low-level concepts which are generally applicable to any processor. Localization of hardware-dependency has the effect of increasing modularity and thus portability. This encapsulation, term

	Widely-used operating systems provide inadequate support for large-scale Internet server applications. Their algorithms and interfaces fail to efficiently support either event-driven or multi-threaded servers. They provide poor control over the scheduling and management of machine resources, making it difficult to provide robust and controlled service. We propose new UNIX interfaces to improve scalability, and to provide fine-grained scheduling and resource management.

We explore processor-cache affinity scheduling of parallel network protocol processing in a setting in which protocol processing executes on a shared-memory multiprocessor concurrently with a general workload of non-protocol activity. We find that affinity scheduling can significantly reduce the communication delay associated with protocol processing, enabling the host to support a greater number of concurrent streams and to provide a higher maximum throughput to individual streams. In addition, ...

We have improved the performance of the Mach 3.0 operating system by redesigning its internal thread and interprocess communication facilities to use continuations as the basis for control transfer. Compared to previous versions of Mach 3.0, our new system consumes 85% less space per thread. Cross-address space remote procedure calls execute 14% faster. Exception handling runs over 60% faster. In addition to improving system performance, we have used continuations to generalize many contro ...
